1 Features
• Integrated Power FET and Current Sensor for Up to 1-A Charge Applications From AC Adapter
• Precharge Conditioning With Safety Timer
• Charge and Power-Good Status Output
• Automatic Sleep Mode for Low Power Consumption
• Integrated Charge-Current Monitor
• Fixed 7-Hour Fast Charge Safety Timer
• Ideal for Low-Dropout Charger Designs for Single-Cell Li-Ion or Li-Pol Packs in Space-Limited Portable Applications
• Small 3.00-mm × 3.00-mm VSON Package

2 Applications
• PDAs, MP3 Players
• Digital Cameras
• Internet Appliances
• Smartphones

3 Description
The bq24080 and bq24081 are highly integrated and flexible Li-Ion linear charge devices targeted at space-limited charger applications. They offer an integrated power FET and current sensor, high-accuracy current and voltage regulation, charge status, and charge termination, in a single monolithic device. An external resistor sets the magnitude of the charge current.

The device charges the battery in three phases: conditioning, constant current, and constant voltage. Charge is terminated based on minimum current. An internal charge timer provides a backup safety for charge termination. The device automatically restarts the charge if the battery voltage falls below an internal threshold. The device automatically enters sleep mode when the ac adapter is removed.

Thermal pad

There is an internal electrical connection between the exposed thermal pad and the VSS pin of the device. The exposed thermal pad must be connected to the same potential as the V<sub>SS</sub> pin on the printed-circuit board. *Do not use the thermal pad as the primary ground input for the device.* The V<sub>SS</sub> pin must be connected to ground at all times.
6 Specifications

6.1 Absolute Maximum Ratings
over operating free-air temperature range (unless otherwise noted)\(^{(1)}\)

</tbody>
</table>

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to \( V_{\text{SS}} \).

6.2 ESD Ratings

<table>
<thead>
<tr>
<th>Electrostatic discharge</th>
<th>VALUE</th>
<th>UNIT</th>

6.6  Typical Characteristics

Figure 1. Dropout Voltage vs Junction Temperature

Figure 2. VIN Hot-Plug Power-Up Sequence

Figure 3. Charge Enable Power-Up Sequence
(CE = High-to-Low)

Figure 4. Battery Hot-Plug During Charging Phase

Figure 5. Battery Hot-Plug and Removal Power Sequence

No battery – In termination deglitch prior to STAT1 going high. \( V_{OUT} \) cycling between charge and done prior to screen capture
Stat1 goes high – In done state
2-V battery is inserted during the charge done state.
Charging is initiated – STAT1 goes low and charge current is applied.
Battery is removed – \( V_{OUT} \) goes into regulation, \( I_{OUT} \) goes to zero, and termination deglitch timer starts running (same as state 1).
Deglitch timer expires – charge done is declared.
7 Detailed Description

7.1 Overview

The device supports a precision Li-Ion, Li-Pol charging system suitable for single cells. Figure 6 shows a typical charge profile, and Figure 7 shows an operational flow chart.

### 7.3 Feature Description

#### 7.3.1 Battery Preconditioning

During a charge cycle, if the battery voltage is below the $V_{\text{LOWV}}$ threshold, the device applies a precharge current, $I_{\text{O(PRECHG)}}$, to the battery. This feature revives deeply discharged cells. Resistor $R_{\text{SET}}$, connected between the ISET and V$_{\text{SS}}$, determines the precharge rate. The $V_{\text{PRECHG}}$ and $K_{\text{SET}}$ parameters are specified in the *Electrical Characteristics* table.

$$I_{\text{O(PRECHG)}} = \frac{K_{\text{SET}} \times V_{\text{PRECHG}}}{R_{\text{SET}}} \quad (1)$$

The device activates a safety timer, $t_{\text{PRECHG}}$, during the conditioning phase. If the $V_{\text{LOWV}}$ threshold is not reached within the timer period, the device turns off the charger and enunciates FAULT on the STATx pins. See the *Timer Fault and Recovery* section for additional details.

#### 7.3.2 Battery Fast-Charge Constant Current

The device offers on-chip current regulation with programmable set point. Resistor $R_{\text{SET}}$, connected between the ISET and V$_{\text{SS}}$, determines the charge rate. The $V_{\text{SET}}$ and $K_{\text{SET}}$ parameters are specified in the *Electrical Characteristics* table.

$$I_{\text{O(OUT)}} = \frac{K_{\text{SET}} \times V_{\text{SET}}}{R_{\text{SET}}} \quad (2)$$

#### 7.3.3 Charge-Current Monitor

When the charge function is enabled internal circuits generate a current proportional to the charge current at the ISET pin. This current, when applied to the external charge current programming resistor $R_{\text{ISET}}$ generates an analog voltage that can be monitored by an external host to calculate the current sourced from the OUT pin.

$$V_{\text{ISET}} = \frac{I_{\text{OUT}} \times R_{\text{ISET}}}{K_{\text{ISET}}} \quad (3)$$

#### 7.3.4 Battery Fast-Charge Voltage Regulation

The voltage regulation feedback is through the OUT pin. This input is tied directly to the positive side of the battery pack. The device monitors the battery-pack voltage between the OUT and V$_{\text{SS}}$ pins. When the battery voltage rises to the $V_{\text{O(REG)}}$ threshold, the voltage regulation phase begins and the charging current begins to taper down.

As a safety backup, the device also monitors the charge time in the charge mode. If charge is not terminated within this time period, $t_{\text{CHG}}$, the charger is turned off and FAULT is set on the STATx pins. See the *Timer Fault and Recovery* section for additional details.

#### 7.3.5 Charge Termination Detection and Recharge

The device monitors the charging current during the voltage regulation phase. Once the termination threshold, $I_{\text{TERM}}$, is detected, charge is terminated. The $V_{\text{TERM}}$ and $K_{\text{SET}}$ parameters are specified in the *Electrical Characteristics* table.

$$I_{\text{O(TERM)}} = \frac{K_{\text{SET}} \times V_{\text{TERM}}}{R_{\text{SET}}} \quad (4)$$

After charge termination, the device restarts the charge once the voltage on the OUT pin falls below the $V_{\text{RCH}}$ threshold. This feature keeps the battery at full capacity at all times.

The device monitors the charging current during the voltage regulation phase. Once the termination threshold, $I_{\text{TERM}}$, is detected, the charge is terminated immediately.

Resistor $R_{\text{SET}}$, connected between the ISET and V$_{\text{SS}}$, determines the current level at the termination threshold.
Feature Description (continued)

7.3.6 Charge Status Outputs
The open-drain STAT1 and STAT2 outputs indicate various charger operations as shown in Table 1. These status pins can be used to drive LEDs or communicate to the host processor. Note that OFF indicates the open-drain transistor is turned off.

Table 1. Status Pin Summary

<table>

<tr>
<td>Sleep mode</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

7.3.7 PG Output (bq24080)
The open-drain power-good (PG) output pulls low when a valid input voltage is present. This output is turned off (high-impedance) in sleep mode. The PG pin can be used to drive an LED or communicate to the host processor.

7.3.8 Charge-Enabled (CE) Input (bq24080)
The CE digital input is used to disable or enable the charge process. A low-level signal on this pin enables the charge and a high-level signal disables the charge and places the device in a low-power mode. A high-to-low transition on this pin also resets all timers and timer fault conditions.

7.3.9 Timer Enabled (TE) Input (bq24081)
The TE digital input is used to disable or enable the fast-charge timer. A low-level signal on this pin enables the fast-charge timer, and a high-level signal disables this feature.

7.3.10 Temperature Qualification (bq24081)
The bq24081 continuously monitors battery temperature by measuring the voltage between the TS and VSS pins. An internal current source provides the bias for common 10-kΩ negative-temperature-coefficient thermistors (NTC) (see the functional block diagram). The device compares the voltage on the TS pin with the internal \( V_{TS1} \) and \( V_{TS2} \) thresholds to determine if charging is allowed. If a temperature outside the \( V_{TS1} \) and \( V_{TS2} \) thresholds is detected, the device immediately suspends the charge by turning off the power FET and holding the timer value (i.e., timers are not reset). Charge is resumed when the temperature returns within the normal range.

The allowed temperature range with a 103AT-type thermistor is 0°C to 45°C. However, the user may modify these thresholds by adding external resistors (see Figure 8 and Figure 9).
7.3.11 Timer Fault and Recovery

As shown in Figure 7, the device provides a recovery method to deal with timer fault conditions. The following summarizes this method:

**7.3.11.1 Condition Number 1**

OUT pin voltage is above the recharge threshold \( V_{(RCH)} \), and a timeout fault occurs.

Recovery method: the device waits for the OUT pin voltage to fall below the recharge threshold. This could happen as a result of a load on the battery, self-discharge, or battery removal. Once the OUT pin voltage falls below the recharge threshold, the device clears the fault and starts a new charge cycle. A POR, TE, or CE toggle also clears the fault.

**7.3.11.2 Condition Number 2**

OUT pin voltage is below the recharge threshold \( V_{(RCH)} \), and a timeout fault occurs.

---

Figure 8. Default Temperature Thresholds

Figure 9. Temperature Thresholds Modified by External Resistors
Recovery method: Under this scenario, the device applies the $I_{(FAULT)}$ current. This small current is used to detect a battery removal condition and remains on as long as the battery voltage stays below the recharge threshold. If the OUT pin voltage goes above the recharge threshold, then the device disables the $I_{(FAULT)}$ current and executes the recovery method described for condition number 1. Once the OUT pin voltage falls below the recharge threshold, the bq24080 clears the fault and starts a new charge cycle. A POR, TE, or CE toggle also clears the fault.

7.4 Device Functional Modes

7.4.1 Sleep Mode

The device enters the low-power sleep mode if the input power (IN) is removed from the circuit. This feature prevents draining the battery during the absence of input supply.
8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information
The bq24080 and bq24081 are highly integrated and flexible Li-Ion linear charge devices targeted at space-limited charger applications. They offer an integrated power FET and current sensor, high accuracy current and voltage regulation, charge status, and charge termination, in a single monolithic device. An external resistor sets the magnitude of the charge current.

8.2 Typical Application

8.2.1 Design Requirements
For this design example, use the parameters shown in Table 2.

Table 2. Design Parameters

<table>
<thead>
<tr>
<th>PARAMETER</th>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supply voltage</td>
<td>5 V</td>
</tr>
<tr>
<td>Fast-charge current</td>
<td>≈ 750 mA</td>
</tr>
<tr>
<td>Battery-Temperature sense (bq24081-Q1)</td>
<td>–2°C to 44.5°C (default setting)</td>
</tr>
</tbody>
</table>
8.2.2 Detailed Design Procedure

8.2.2.1 Calculations

Program the charge current for 750 mA:

\[ R_{\text{SET}} = \left[ \frac{V_{\text{SET}} \times K_{\text{SET}}}{I_{\text{OUT}}} \right] \]  

(5)

From Electrical Characteristics table, \( V_{\text{SET}} = 2.5 \) V.

From Electrical Characteristics table, \( K_{\text{SET}} = 322 \).

\[ R_{\text{SET}} = \left[ \frac{2.5 \times 322}{0.75} \right] = 1.073 \, \text{k\Omega} \]  

(6)

Selecting the closest standard value, use a 1.07-k\Omega resistor connected between ISET (pin 6) and ground.

8.2.2.2 Battery Temperature Sense (bq24081)

Use a Semitec 103AT-4 NTC thermistor connected between TS (pin 9) and ground.

\[ R_{\text{THERM-cold}} = \left[ \frac{V_{\text{TS1}}}{I_{\text{TS}}} \right] = \frac{2.5}{100 \, \mu\text{A}} = 25 \, \text{k\Omega} \]  

(7)

\[ R_{\text{THERM-hot}} = \left[ \frac{V_{\text{TS2}}}{I_{\text{TS}}} \right] = \frac{0.5}{100 \, \mu\text{A}} = 5 \, \text{k\Omega} \]  

(8)

Look up the corresponding temperature value in the manufacturer's resistance-temperature table for the thermistor selected. For a 103AT-4 Semitec thermistor:

5 k\Omega = 44.5°C

25 k\Omega = 2°C

8.2.2.3 STAT Pins (All Devices) and PG Pin (bq24080)

Status pins Monitored by Processor:

Select a pullup resistor that can source more than the input bias (leakage) current of both the processor and status pins and still provide a logic high.

\[ R_{\text{PULLUP}} \leq \left[ \frac{V_{\text{cc-pullup}} - V_{\text{logic hi-min}}}{(I_{\text{µP-monitor}} + I_{\text{STAT-OpenDrain}})} \right] = \frac{(3.3 \, \text{V} - 1.9 \, \text{V})}{(1 \, \mu\text{A} + 1 \, \mu\text{A})} \leq 700 \, \text{k\Omega}; \]  

(9)

Connect a 100-k\Omega pullup between each status pin and the \( V_{\text{CC}} \) of the processor. Connect each status pin to a \( \mu\text{P} \) monitor pin.

Status viewed by LED:

Select an LED with a current rating less than 10 mA and select a resistor to place in series with the LED to limit the current to the desired current value (brightness).

\[ R_{\text{LED}} = \left[ \frac{V_{\text{IN}} - V_{\text{LED-on}}}{I_{\text{LED}}} \right] = \frac{(5 \, \text{V} - 2 \, \text{V})}{1.5 \, \text{mA}} = 2 \, \text{k\Omega}. \]  

(10)

Place an LED and resistor in series between the input and each status pin.

8.2.2.4 Selecting Input and Output Capacitors

In most applications, all that is needed is a high-frequency decoupling capacitor on the input power pin. A 0.1-\mu\text{F} ceramic capacitor, placed in close proximity to the IN pin and GND pad works well. In some applications, it may be necessary to protect against a hot plug input voltage overshoot. This is done in three ways:

1. The best way is to add an input zener, 6.2 V, between the IN pin and \( V_{\text{SS}} \).

2. A low-power zener is adequate for the single event transient. Increasing the input capacitance lowers the characteristic impedance which makes the input resistance move effective at damping the overshoot, but risks damaging the input contacts by the high inrush current.

3. Placing a resistor in series with the input dampens the overshoot, but causes excess power dissipation.

The device only requires a small capacitor for loop stability. A 0.1-\mu\text{F} ceramic capacitor placed between the OUT and GND pad is typically sufficient.
8.2.3 Application Curves

Figure 11. Charge Enable Power-Up Sequence
(CE = High-to-Low)

Figure 12. Battery Hot-Plug and Removal Power Sequence

9 Power Supply Recommendations

The devices are intended to operate within the ranges shown in Recommended Operating Conditions. Because the input of the device on pin IN is subject to a power source that is external, care must be taken to not exercise the pin above the Absolute Maximum Rating of the Pin shown in the Absolute Maximum Ratings table.
10 Layout

10.1 Layout Guidelines

10.1.1 Layout Guidelines

It is important to pay special attention to the PCB layout. The following provides some guidelines:

- To obtain optimal performance, the decoupling capacitor from \( V_{CC} \) to \( V_{IN} \) and the output filter capacitors from OUT to \( V_{SS} \) should be placed as close as possible to the device, with short trace runs to both signal and \( V_{SS} \) pins. The \( V_{SS} \) pin should have short trace runs to the GND pin.
- All low-current \( V_{SS} \) connections should be kept separate from the high-current charge or discharge paths from the battery. Use a single-point ground technique incorporating both the small-signal ground path and the power ground path.
- The high-current charge paths into IN and from the OUT pins must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces.
- The device is packaged in a thermally enhanced MLP package. The package includes a thermal pad to provide an effective thermal contact between the device and the printed circuit board (PCB). Full PCB design guidelines for this package are provided in the application report entitled, *QFN/SON PCB Attachment* (TI Literature Number SLUA271).

10.1.2 Layout Example

![Figure 13. Board Layout](image-url)

Figure 13. Board Layout
Layout Guidelines (continued)

10.1.3 Thermal Considerations

The bq24080 and bq24081 are packaged in a thermally enhanced MLP package. The package includes a thermal pad to provide an effective thermal contact between the device and the printed-circuit board (PCB). Full PCB design guidelines for this package are provided in the application report entitled, QFN/SON PCB Attachment (TI Literature Number SLUA271).

The most common measure of package thermal performance is thermal impedance ($R_{thJA}$) measured (or modeled) from the device junction to the air surrounding the package surface (ambient). The mathematical expression for $R_{thJA}$ is:

$$R_{thJA} = \frac{T_J - T_A}{P}$$

(11)

Where:

- $T_J =$ device junction temperature
- $T_A =$ ambient temperature
- $P =$ device power dissipation

Factors that can greatly influence the measurement and calculation of $R_{thJA}$ include:

- Orientation of the device (horizontal or vertical)
- Volume of the ambient air surrounding the device under test and airflow
- Whether other surfaces are in close proximity to the device being tested
- Use multiple 10–13 mil vias in the PowerPAD™ to copper ground plane.
- Avoid cutting the ground plane with a signal trace near the power IC.
- The PCB must be sized to have adequate surface area for heat dissipation.
- FR4 (fiberglass) thickness should be minimized.

The device power dissipation, $P$, is a function of the charge rate and the voltage drop across the internal Power FET. It can be calculated from the following equation:

$$P = (V_{IN} - V_{OUT}) \times I_{O(OUT)}$$

(12)

Due to the charge profile of Li-xx batteries, the maximum power dissipation is typically seen at the beginning of the charge cycle when the battery voltage is at its lowest. See Figure 6.
11 Device and Documentation Support

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

**TI E2E™ Online Community** TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** TI's Design Support Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.5 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.7 Glossary

**SLYZ022** — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

</tbody>
</table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
- **TBD**: The Pb-Free/Green conversion plan has not been defined.
- **Pb-Free (RoHS)**: TI’s terms “Lead-Free” or “Pb-Free” mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
- **Pb-Free (RoHS Exempt)**: This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
- **Green (RoHS & no Sb/Br)**: TI defines “Green” to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

MECHANICAL DATA

DRC (S-PVSON-N10) PLASTIC SMALL OUTLINE NO-LEAD

NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. Small Outline No-Lead (SON) package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present.

4204102-3/L 09/11
THERMAL INFORMATION
This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal via, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and/or implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, “Designers”) understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers’ applications and compliance of their applications (and of all TI products used in or for Designers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, “TI Resources”) are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer’s company) agrees to use any particular TI Resource solely for the purpose and subject to the terms of this Notice.

TI’s provision of TI Resources does not expand or otherwise alter TI’s applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO THE PATENT RIGHTS, COPYRIGHTS, TRADEMARKS, OTHER INTELLECTUAL PROPERTY RIGHTS OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED “AS IS” AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers’ own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.
